B&C OFFICIAL MEASURER

INSTRUCTIONS FOR MEASURING MUSK OX

All measurements must be made with a 1/4-inch wide flexible steel tape and adjustable calipers to the nearest one-eighth of an inch. Enter fractional figures in eighths, without reduction. Official measurements cannot be taken until horns have air dried for at least 60 days after the animal was killed.

- A. Greatest Spread** is measured between perpendiculars at a right angle to the center line of the skull. **Greatest spread does not add into the final score.**
- B. Tip to Tip Spread** is measured between tips of horns. **Tip to tip spread does not add into the final score.**
- C. Length of Horn** is measured along center of upper horn surface, staying within curve of horn as illustrated, to a point in line with tip. Attempt to free the connective tissue between the horns at the center of the boss to determine the lowest point of horn material on each side. Hook the tape under the lowest point of the horn and measure the length of horn, with the measurement line maintained in the center of the upper surface of horn following the converging lines to the horn tip. A flexible steel cable may be substituted for the 1/4-inch steel tape for this measurement only.
- D-1. Width of Boss** is measured with calipers at greatest width of the boss, with measurement line forming a right angle with horn axis. It is often helpful to measure D-1 before C, marking the midpoint of the boss as the correct path of C.
- D-2-3-4. Divide measurement C** of longer horn by four. Starting at base, mark both horns at these quarters (even though the other horn is shorter). Then, using calipers, measure width of boss at D-2, making sure the measurement is at a right angle to horn axis and in line with the D-2 mark. Circumferences are then measured at D-3 and D-4, with measurements being taken at right angles to horn axis.
